

Setting Priorities and Defining Criteria for Developing New SPPIs in Israel

Zoya Nissanov

The Israeli economy

Revenue by industry, 2021

- Services
- Wholesale and retail trade, and repair of motor vehicles
- Construction
- Electricity and water supply, sewerage and waste management
- Manufacturing; mining and quarrying
- Agriculture, forestry and fishing

Revenue by industry, 2011-2021

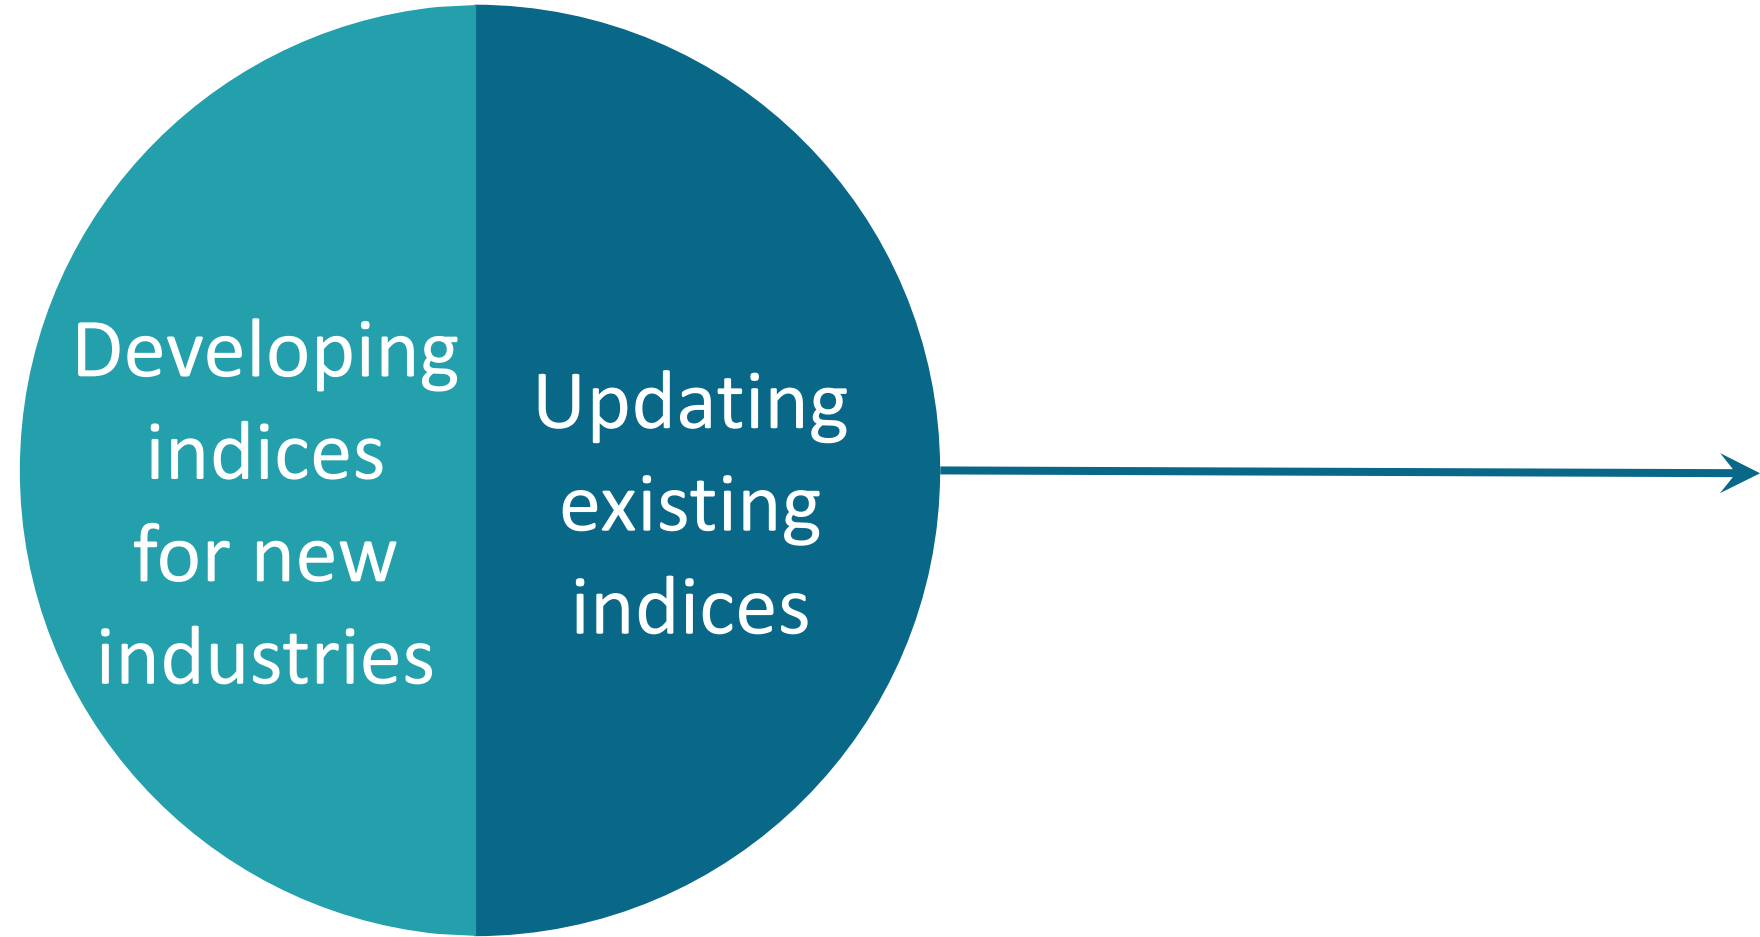

Motivation to define criteria for setting priorities:

More than 40
service industries

To improve
the statistical series
in the fields of
National Accounts

Resource
constraints

The work plan

Updating existing indices

Publishing
activities
(58)

Legal and accounting
activities
(69)

Activities of head offices;
management consultancy
activities
(70)

Advertising
and market
research
(73)

Employment
activities
(78)

Security and
investigation
activities
(80)

Services
to buildings and
landscape activities
(81)

Contribution to GDP

Necessity to have
accurate deflators
for National Accounts

The industry's level
of complexity in terms
of the difficulty in
developing price indices

Criteria for developing SPPIs:

1. Contribution to GDP

The **greater**
the **relative weight**
of the **industry**

The **higher**
the **priority**

Criteria for developing SPPIs:

2. The level of complexity of the industry according to the difficulty in developing price indices

The **greater** the **experience** in developing the price index and the **richer** the professional **literature** on the subject

The **less complex** the **development** of the index will be

Criteria for developing SPPIs:

2. The level of complexity of the industry according to the difficulty in developing price indices

The greater the experience in developing the price index and the richer the professional literature on the subject

The less complex the developing of the index will be

There are industries that are complicated to measure despite the existing methodology (wholesale trade, computer programming and R&D)

Criteria for developing SPPIs:

3. Necessity to have accurate deflators for NA

The level of necessity for National Accounts is determined by two factors:

The rate
of intermediate
uses/gross fixed capital
formation/exports
versus private
consumption

The deflator that
is presently used
in National Accounts

Necessity to have accurate deflators for NA

Factor 1: The deflator that is presently used in NA

A high level of necessity is given to industries that use a general consumer price index since no suitable index has been found for that industry.

The rate of private consumption within the industry is **not high**

The consumer price index **does not** reflect the change

Necessity to have accurate deflators for NA

Factor 2: The rate of intermediate uses/gross fixed capital formation/exports versus private consumption

The rate of private consumption within the industry is **high**

The consumer price index **can be used** as a deflator index

The rate of intermediate uses/gross fixed capital formation/exports versus private consumption

high level

(intermediate uses/export of goods of **over 70%**)

medium level

(intermediate uses/export of goods of **50-69%**)

low level

(intermediate uses/export of goods **less than 50%**)

The order of priorities

Data

The weight of the industry
in the total trade
and services sector

The level of necessity,
according
to the rates of use

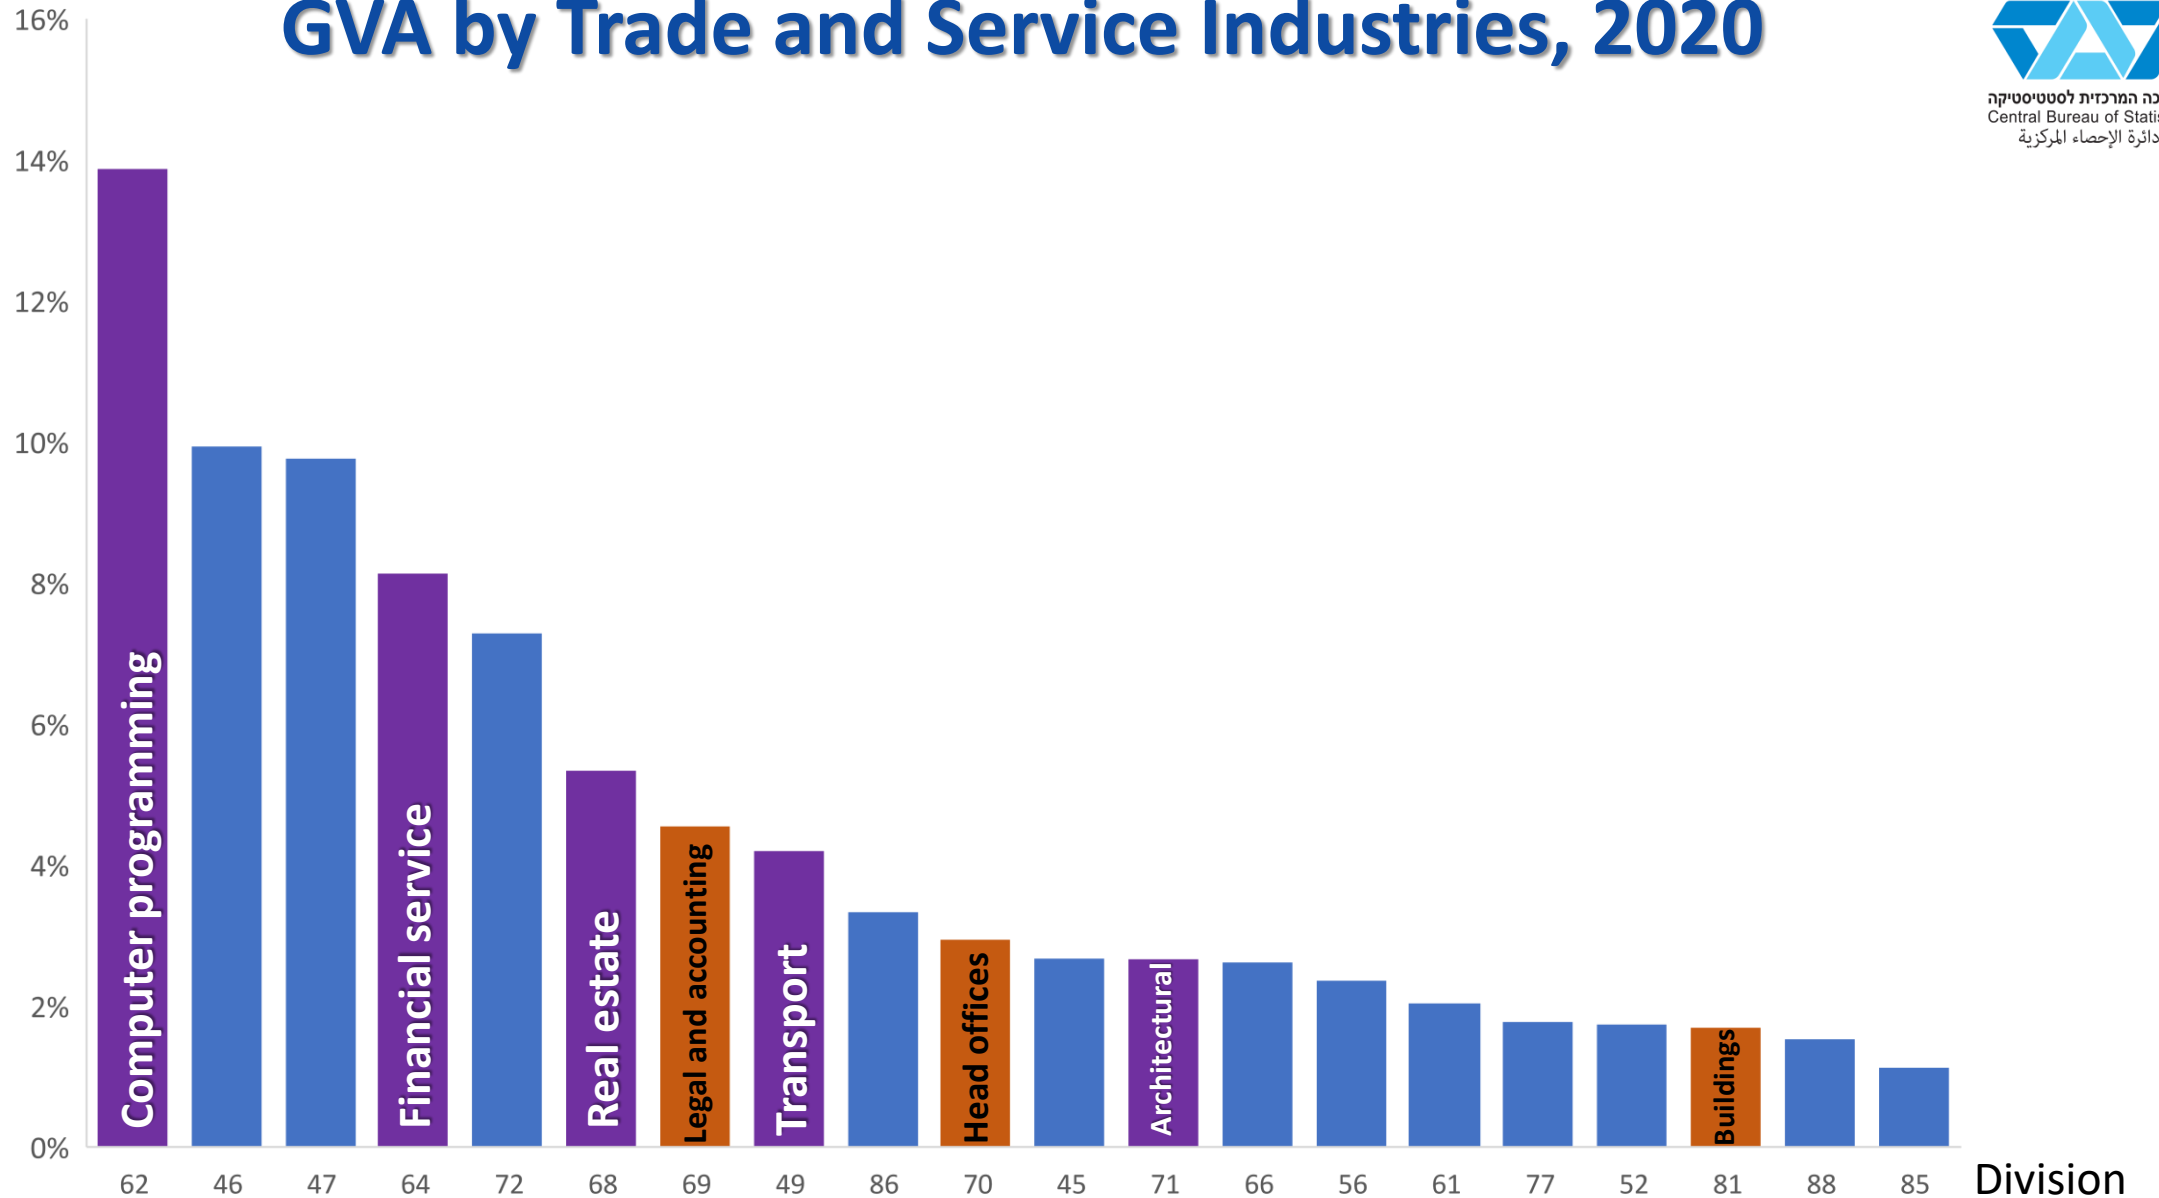

The index that is
presently used in National
Accounts as a deflator

The list of countries that
have already developed
an index for the industry

GVA by Trade and Service Industries, 2020

(62) Computer programming, consultancy and related activities

Reasons for selection

The largest industry
in trade and services

High level of necessity
due to the high rates
of export, investment,
and intermediate uses

Attempts to develop
an index in the past

Developed
and measured
by many countries

(68) Real estate activities

Reasons for selection

The sixth industry
in trade and services
(the fifth in 2018)

High level of necessity
due to the high rate
of intermediate uses

A need raised by
the Bank of Israel

(71) Architectural and engineering activities; technical testing and analysis

Reasons for selection

Attempts to develop an index in the past

High level of necessity due to the high rates of export, investment, and intermediate uses

(49) Land transport and transport via pipelines

Reasons for selection

The eighth industry
in trade and services
(the seventh in 2018)

High level of necessity

A need raised by
National Accounts

Developed
and measured
in many countries

(64) Financial service activities, except insurance and pension funding

Reasons for selection

The fourth industry
in trade and services

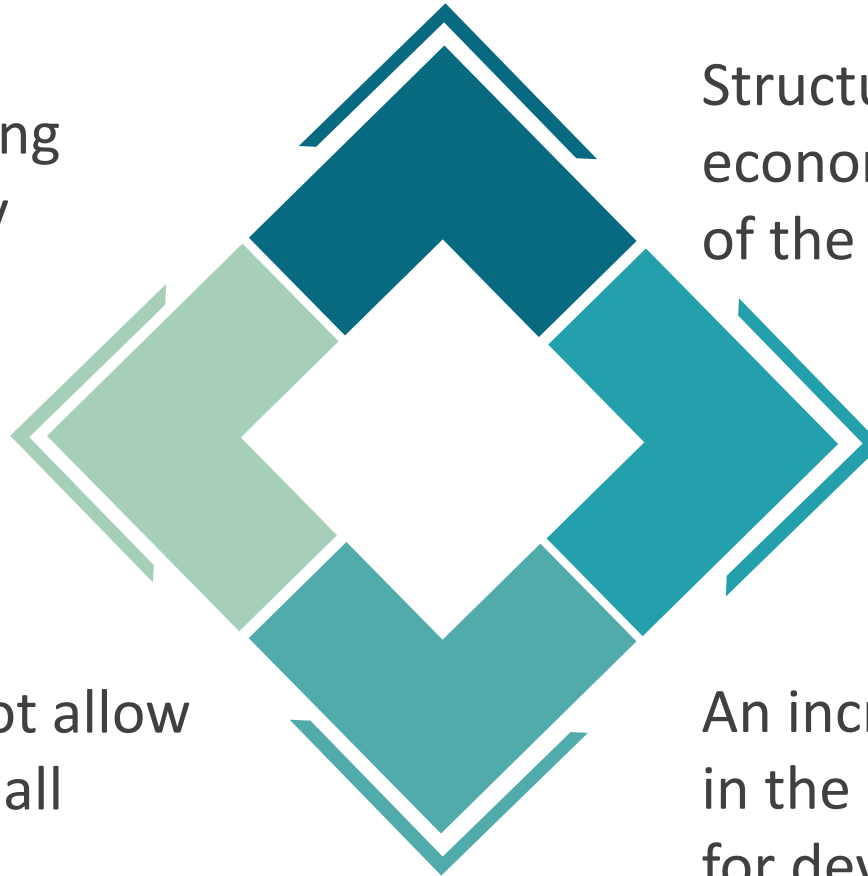

A need raised by
National Accounts

Conclusion

The main criterion for setting priorities was the necessity for National Accounts.

Structural changes in the Israeli economy require adaptation of the PPIs.

Resource constraints do not allow concurrent developing for all relevant industries.

An increase in the share of services in the GDP raises the need for developing new SPPIs.

Thank you!
